

Uninterrupted Power Supply

With SCS Group in Partnership with Constant Power Services (CPS) we maintain a significant level of UPS stock in the UK, with units usually available from 4kVA up to 300kVA to ensure that urgent requirements can be fulfilled within days rather than weeks. Maintenance bypass panels are designed and built in-house and as a further commitment to our customers, we support our installations with a comprehensive spares holding, 24-7 emergency callout facilities and preventative maintenance agreements.

General Specification

An Uninterruptible Power Supply (UPS) is used to protect critical loads from mains supply problems, including spikes, voltage dips, fluctuations and complete power failures using a dedicated battery. A UPS system can also be used to 'bridge the gap' whilst a standby generator is started and synchronised.

UPS Display...The Planet UPS incorporates a user friendly, multi-language alphanumeric display. Full system operating status, alarm conditions, measurement values can be displayed and are automatically stored into an events memory providing a history of up to a maximum of 999 entries.

Product Data

PLANET UPS SYSTEM from 20 to 80kVA

- True online double conversion (VFI)
- Incorporates output Isolation transformer
- Single and three phase output designs
- Suitable for dual input supply as standard
- Integral battery capacity (up to 30kVA)
- External cubicles for longer autonomy
- SNMP device and remote panels available
